FREELANCE WEB SITE MANAGEMENT

Abstract:-

Freelance website is a marketplace where employers and employees are able to find each other. The site allows employers to post work for site members who place bids in a competitive tender process. The site also allows members to host and enter contests for which prize money is offered as a reward. Freelancers and employers develop profiles on the site as they offer, win and complete work and write and receive reviews of people they work with or for. The site's members receive a finite number of bids to use on the site, which are periodically replenished. A series of account options are offered, ranging from free accounts through to professional subscriptions.

Freelancer takes a 10% fee, which can be reduced with paid monthly membership, with a minimum fee .The company has recently announced its new move into home and local services, The freelance website enable you to, if you have a talent, you can share that talent with our buyer community and make money while you are at it. Project Objective

The main objective of this project is to develop a web site for job seeker and job providers. This site will reduce the manpower. The admin and each customers has a unique User ID and Password. Using this User Id and Password they can login to the system and get the facilities. The main objectives of the "freelancer website" are as follows

- User friendly menus with many online transactions using a database
- The freelancer neither have a boss to control you so you can make your goals smart.
- Priorities your goals ,choose your own jobs and provide works for your own interests.
- Time saving
- Data validation, integrity and security should be maintained.
- Interactive and user friendly environment.
- Easy to use, consistency and simplicity
- Retrieval of data at proper time and Money saving

The **proposed system** fully convert the manual system to computerized system .So reduce the visit of job centers to do works and provide works. Through this we have to save more times for jobs. . All the process are controlled by the software. It is fully controlled by the server machine. The user can access the system and all process in it very fast. It is fast, reliable and more accurate, Also computerized record keeping and calculation.

There is a security feature built in to the system since all information in the database is confidential and is therefore accessed only by the authorized users the access is given only to a correct password entry. Error handling has been done efficiently. Errors that could happen during data entries are informed to user.
